ABSTRACT

A Social Accounting Matrix (SAM) is an accounting framework that gives a quantitative overview of the structure of the economy over a given time period. It records all transactions between economic agents, while respecting the principles of circularity of flows and balance between revenues and expenditures for each account.

The level of disaggregation of accounts in the matrix varies according to the analyses to be undertaken and data availability. The accounts in a national SAM generally are production activities, commodities, institutions, and factors of production. For economic analyses and planning, a more detailed SAM is constructed. These involve disaggregation of activities, households, and factors of production from the more general national SAM. In such matrices, the national economy often will also be disaggregated into sub-national regions. Such SAMs provide rich datasets to help decision-makers in developing, designing, and evaluating regional economic and investment policies.

As part of the technical cooperation within the (Arab) Agricultural Investment Development Analyzer (AIDA) project, which aims to develop tools for planning and evaluating investment projects in the agricultural sector, the Institut Tunisien de la Compétitivité et des Etudes Quantitatives (ITCEQ – the Tunisian Institute of Competitiveness and Quantitative Studies), in collaboration with the International Food Policy Research Institute (IFPRI), have built a regionalized SAM of the Tunisian economy with detailed disaggregation at the sector, product, household, and regional levels. This SAM has been constructed using IFPRI's Nexus format, which uses common data standards, procedures, and classification systems for constructing and updating national SAMs.

The regionalized SAM for Tunisia was built using national accounts statistics for the country, the Supply and Use Tables for 2015, which are produced by the National Institute of Statistics (NIS). The regionalized matrix is constructed in three steps – national, household, and regional.

- The national 2015 SAM for Tunisia includes 46 sectors and 46 products.
- For the household SAM, factors of production are split into 13 categories. Capital is disaggregated into four subcategories: crops, livestock, mining, and other. Land is a separate factor of production category. Labor is disaggregated into four education-level categories and across rural and urban areas. For the household SAM, household accounts are split into 15 categories by rural farm, rural nonfarm, and urban categories and then by national per capita expenditure quintiles.
- For the regionalized SAM, sectoral production, production factors, and household groups are disaggregated into seven subnational regions: Greater Tunis, North East, North West, Center East, Center West, South East, and South West. The regional 2015 SAM in total has 105 household groups and is composed of 513 rows x 513 columns.

1. SOCIAL ACCOUNTING MATRICES

A national social accounting matrix (SAM) is an economy-wide data framework that captures the detailed economic structure of a country. A SAM is a square matrix in which each account is represented by a row and a column.¹ Each cell reflects a payment from the column account to the row account, i.e., incomes appear along rows and expenditures along columns. Double-entry accounting requires that, for each account, total revenue (row total) equals total expenditure (column total). Table 1 shows an aggregate SAM, with verbal explanations in place of numbers.

Activities and commodities: Standard SAMs created under the Nexus project² distinguish between “activities” (entities that carry out production) and “commodities” (representing markets for goods and non-factor services). SAM flows are valued at producer prices in activity accounts and at market prices in commodity accounts, i.e., inclusive of indirect taxes and transactions cost margins. Commodities consist of activity outputs, either exported or sold domestically, and imports. In the activity columns, payments are made to commodities (intermediate demand) and factors of production (value-added, equal to operating surplus and compensation of employees). In the commodity columns, payments are made to domestic activities, the rest of the world, and various tax accounts (for domestic and import taxes).

Government income and payments: The government in a Nexus SAM is disaggregated into a core government account and various tax collection accounts. Tax accounts are necessary since otherwise the economic interpretation of certain payments becomes ambiguous. Direct payments between the government and other domestic institutions are reserved for transfers. Payments from the government to factors are captured in the government services activity. Government consumption demand is a purchase of the output from the government services activity, which, in turn, pays labor.

¹ For a lengthier discussion on SAMs, see Pyatt and Round (1985) and Reinert and Roland-Holst (1997).

² The Nexus Project is a collaboration between international organizations and national statistical agencies and research institutions to improve the quality of social accounting matrices (SAMs) used for country-level computable general equilibrium (CGE) modeling. The Nexus Project establishes common data standards, procedures, and classification systems for constructing and updating national SAMs. The Project addresses the need for greater transparency and consistency in SAM construction in order to strengthen model-based research and policy analysis in developing countries. It also supports more robust cross-country comparisons of economic structure and policy. The guiding principle of the Nexus Project is that all SAM data should be traceable to its original sources and/or assumptions. Nexus SAMs are freely available online or from collaborating organizations and statistical agencies.

The Nexus Project is led by the International Food Policy Research Institute (IFPRI). Participating organizations include the Food and Agriculture Organization (FAO), the International Fund for Agricultural Development (IFAD), the European Community's Institute for Prospective Technological Studies (JRC-IPTS), the World Bank, and the United Nations University's World Institute for Development Economics Research (UNU-WIDER). Nexus SAMs are often constructed together with national statistical agencies and are regularly updated to include the most recent available data. The African Growth and Development Policy Modeling (AGRODEP) network helps disseminate Nexus SAMs to African researchers.

IFPRI's participation in the Nexus Project is funded by the CGIAR Research Program (CRP) on “Policies, Institutions and Markets” (PIM). Please contact Dr. James Thurlow, IFPRI, Washington D.C. Email: j.thurlow@cgiar.org.

Table 1: Standard Nexus Macro Social Accounting Matrix

	Activities	Commodities	Factors	Enterprises	Households	Government	Taxes	Investment	Rest of the World	Total
Activities		Marketed outputs			Private non-marketed consumption					Activity income
Commodities	Intermediate demand	Transaction costs			Private marketed consumption	Government consumption		Gross capital formation	Exports	Total demand
Factors	Value-added								Foreign transfers to factors	Factor income
Enterprises			Factor income to enterprises			Government transfers to enterprises			Foreign transfers to enterprises	Enterprise income
Households			Factor income to households	Enterprise transfers to households		Government transfers to households			Foreign transfers to households	Household income
Taxes	Taxes on producers	Taxes on products	Factor taxes	Corporate taxes	Household taxes					Tax income
Government				Enterprise transfers to government	Household transfers to government		Tax revenues paid to government		Foreign transfers to government	Government income
Savings				Enterprise savings	Household savings	Government savings			Foreign savings	Savings
Rest of the World		Imports	Factor payments abroad	Enterprise payments abroad	Household payments abroad	Government payments abroad				Foreign exchange outflow
Total	Activity expenditures	Total supply	Factor expenditures	Enterprise expenditures	Household expenditures	Government expenditures	Tax payments	Investment	Foreign exchange inflow	

Domestic nongovernment institutions: Domestic non-government institutions consist of households and enterprises. Enterprises earn factor incomes, reflecting their ownership of capital, and receive transfers from other institutions. Enterprise incomes are used for corporate taxes, enterprise savings, and transfers to other institutions. Unlike households, enterprises do not demand commodities. In the SAM, enterprises are an aggregation of financial and nonfinancial corporations, as defined within the United Nation's System of National Accounts (UN 2009).

Household consumption: Nexus SAMs distinguish between home (own) consumption of activities and marketed consumption of commodities by households. Home consumption, which appears in the SAM as payments from household accounts to activity accounts, is valued at producer prices, i.e., without marketing margins and sales taxes that may be levied on marketed commodities. Final household consumption of marketed commodities appears as payments from household accounts to commodity accounts, valued at consumer prices, including marketing margins and taxes.

2. STANDARD NEXUS SOCIAL ACCOUNTING MATRIX ACCOUNTS

Activities and commodities: Standard SAMs created under the Nexus project separate domestic production into 86 activities, as shown in Table 2. Each activity represents a group of industries from the International Standard Industrial Classification system (ISIC Revision 4) (UNDESA 2008). The 4-digit ISIC codes corresponding to each SAM activity are shown in Table A1 in the Appendix.³ Agricultural activities are further disaggregated using FAO's classification system, as shown in Table A2 in the Appendix. Information on production technologies comes from national input-output tables (IOT) or supply-use tables (SUT). Activities and commodities have a one-to-one mapping based on a concordance between ISIC industries and Harmonized System products (HS Version 2007).⁴ Some countries' national accounts capture how activities can produce multiple commodities – this information is discarded in Nexus SAMs. (See the description of Tunisia's SAM in Section 5.)

Factors of production: Nexus SAMs separate factors into three broad categories: labor, land, and capital. Labor is further disaggregated across rural and urban areas and into four education-based categories, as shown in Table 3. Nexus SAMs follow official definitions of "rural" and "urban" areas, which may vary between countries, but are consistent with the definitions used in national and international statistics.⁵ There is greater consistency in education categories across countries since these are based on the number of years of schooling that workers report having completed (see the notes provided in Table 3). Information on total labor value-added as a share of sectoral gross domestic product (GDP) is drawn from national IOTs or SUTs. This is disaggregated across labor subcategories using wage and salary data as well as imputed earnings for unpaid family members as reported in household and labor force surveys (see Section 5).

³ Mapping between Nexus SAM activities and ISIC Revision 3.1 codes (UNDESA 2002) are available upon request.

⁴ The concordance between Nexus SAM commodities and HS 2007 codes are available upon request.

⁵ Rural and urban status is based on workers' reported place of residence, rather than their place of work. This is consistent with most household and labor force surveys, and hence with most official statistics.

Table 2. Activities and Commodities in the Standard Nexus Social Accounting Matrix

Code	Description	Code	Description	Code	Description
maiz	Maize	eggs	Eggs	clth	Clothing

Table 3. Factors in the Standard Nexus Social Accounting Matrix

Code	Description	Notes
Labor		
flab-rn	Labor - rural uneducated	0-6 years of formal schooling
flab-rp	Labor - rural primary	7-11 years of formal schooling
flab-rs	Labor - rural secondary	12+ years of formal schooling and/or incomplete tertiary education
flab-rt	Labor - rural tertiary	Completed tertiary education (e.g., degree, certificate, diploma)
flab-un	Labor - urban uneducated	0-6 years of formal schooling
flab-up	Labor - urban primary	7-11 years of formal schooling
flab-us	Labor - urban secondary	12+ years of formal schooling and/or incomplete tertiary education
flab-ut	Labor - urban tertiary	Completed tertiary education (e.g., degree, certificate, diploma)
Land		
flnd	Land - agricultural crops	Harvested crop land
Capital		
fcap-c	Capital - crops	For agricultural crops (e.g., tractors, irrigation infrastructure)
fcap-l	Capital - livestock	For livestock (e.g., live animals, paddocks, beehives)
fcap-m	Capital - mining	For mining (e.g., mineral resources, mining equipment)
fcap-o	Capital - other	For all other sectors, including forestry and fisheries

Capital is disaggregated into four subcategories: crops, livestock, mining, and other. Crop capital in each crop-based agricultural activity is the portion of gross operating surplus (GOS) and mixed income that is reported in national IOTs or SUTs and is not assigned to either labor or land factors, i.e., it is a residual. Livestock capital is the total GOS generated in the three livestock activities, i.e., cattle, poultry, and other livestock, while mining capital is the total GOS earned in the four mining activities, i.e., coal and lignite, crude oil, natural gas, and other mining. Crop and livestock capital are separated from mining and other capital, since in Nexus SAMs the former are paid directly to households, while the latter are paid to enterprises. Mining capital is separated from “other” capital because its earnings are often subject to mining-specific taxes and royalties, and they are more likely to be repatriated to foreign-based companies.

Households: Nexus SAMs separate national populations into 15 representative household groups, as shown in Table 4. As with labor, the SAM distinguishes between rural and urban households using a country’s official definition of these areas. Rural households are further disaggregated into households that earn crop and/or livestock incomes, i.e., farm households, and those that do not earn incomes from either source, i.e., nonfarm households.

Table 4. Household Types in the Standard Nexus Social Accounting Matrix

Code	Description	Notes
hhd-f1	Rural farm - quintile 1	Rural households with crop and/or livestock incomes separated into national per capita expenditure quintiles
hhd-f2	Rural farm - quintile 2	
hhd-f3	Rural farm - quintile 3	
hhd-f4	Rural farm - quintile 4	
hhd-f5	Rural farm - quintile 5	
hhd-n1	Rural nonfarm - quintile 1	Rural households without crop and/or livestock incomes separated into national per capita expenditure quintiles
hhd-n2	Rural nonfarm - quintile 2	
hhd-n3	Rural nonfarm - quintile 3	
hhd-n4	Rural nonfarm - quintile 4	
hhd-n5	Rural nonfarm - quintile 5	
hhd-u1	Urban - quintile 1	Urban households with or without crop and/or livestock incomes separated into national per capita expenditure quintiles
hhd-u2	Urban - quintile 2	
hhd-u3	Urban - quintile 3	
hhd-u4	Urban - quintile 4	
hhd-u5	Urban - quintile 5	

Households are further disaggregated into per capita expenditure quintiles. Quintiles are defined at the national level, meaning that rural and urban quintiles are comparable and the combined population of each quintile is a fifth of the national population. Per capita expenditure groups are not adjusted for adult-equivalency and are based on the value of all consumption expenditure items reported in national household surveys. The latter point implies that the definition of quintiles in Nexus SAMs may deviate slightly from those based on poverty-oriented consumption measures, which may exclude “non-essential” nonagricultural expenditure items, e.g., airplane tickets or gambling.

Other accounts: The remaining accounts in the Nexus SAMs are shown in the bottom rows of Table 5. These include the transaction costs of moving goods between producers, domestic markets, and national borders, as well as the various indirect taxes imposed on marketed commodities.

Table 5. Accounts in the Standard Nexus Social Accounting Matrix

Code	Description	Notes
a___	Activities	See Table 2 for the list of activity accounts
c___	Commodities	See Table 2 for the list of commodity accounts
f___	Factors	See Table 3 for the list of factor accounts
h___	Households	See Table 4 for the list of household accounts
trc	Transaction costs	From moving goods between producers, markets, and/or borders
ent	Enterprises	Financial and non-financial corporations
gov	Government	Government as an institution, not as a producing activity
atax	Taxes - activity	Indirect taxes on producers
dtax	Taxes - direct	Direct taxes on enterprises and households
etax	Taxes - export	Indirect taxes on exports
ftax	Taxes - factor	Direct taxes on factor incomes
mtax	Taxes - import	Indirect taxes on imports (import duties)
stax	Taxes - sales	Indirect taxes on domestic sales (VAT, GST and excise duty)
s-i	Savings-investment	Investment is gross fixed capital formation
dstk	Change in stocks	Inventory accumulation or depletion
row	Rest of world	All foreign countries and economies
total	Total	Row and column totals

Sex-disaggregated and regional accounts: Standard Nexus SAMs often include variants with more detailed accounts. Each SAM variant aggregates back to the Standard Nexus SAM (note that the 86-sector national SAM is labeled “v86N”). It should be noted that adding more detail to a SAM often requires greater use of assumptions and proxy variables for distributing incomes and expenditures, and it can stretch the representativeness of survey data. The Nexus Project therefore publishes its national SAMs separately from its regional and gendered SAMs.

Gendered Nexus SAMs (v86G) disaggregate each labor category in Table 3 into male and female workers. Land, livestock, and agricultural capital are disaggregated based on the gender of the *de jure* household head whose household reports incomes from these factors. Each household group in Table 4 are disaggregated according to whether they have a male or female household head. Accounts that change between the Standard and Gendered Nexus SAMs are shown in Table 6.

Table 6. Gendered Accounts in the Nexus Social Accounting Matrix

Code	Description
flab-__-m	Male labor (see Table 3 for further codes)
flab-__-f	Female labor (see Table 3 for further codes)
flnd-m	Crop land owned by male-headed households
flnd-f	Crop land owned by female-headed households
fcap-c-m	Crop capital owned by male-headed households
fcap-c-f	Crop capital owned by female-headed households
fcap-l-m	Livestock capital owned by male-headed households
fcap-l-f	Livestock capital owned by female-headed households
hhd-__-m	Male headed households (see Table 4 for further codes)
hhd-__-f	Female headed households (see Table 4 for further codes)

Regional Nexus SAMs (v70R) aggregate the 86 activities into 70 activities, which are in turn disaggregated by subnational region. A mapping between v86N and v70R can be found

in Table A3 in the Appendix. In some cases, only certain activities, such as agriculture, are regionally disaggregated due to data limitations. All factors and households are defined by region, except for mining and “other” capital. Accounts that change between the Standard and Regional Nexus SAMs are shown in Table 7.

Table 7. Regional Accounts in the Nexus Social Accounting Matrix

Code	Description
a____-r_	Activities by numbered region of operation (see Table 1 for further codes)
flab-__-r_	Labor by numbered region of employment (see Table 2 for further codes)
flnd- r_	Crop land by numbered region
fcap-c- r_	Crop capital by numbered region of use
fcap-l- r_	Livestock capital by numbered region of use
hhd-__- r_	Households by numbered region (see Table 4 for further codes)

Country-specific deviations from the standard structure: The SAM structure presented above represents the minimum level of disaggregation required of a Nexus SAM. Some countries have more disaggregated accounts, but these can always be aggregated to the Standard Nexus accounts. Section 5 documents any extensions to the Standard Nexus SAM structure that were used in developing the SAM for Tunisia.

3. NEXUS SOCIAL ACCOUNTING MATRIX ENTRIES AND GENERAL DATA SOURCES

The previous section outlined the broad structure of a Nexus SAM, including its standardized classification of accounts. This section describes the information included in each row and column entry in the Macro SAM. One advantage of Nexus SAMs is that the Macro SAM has a common classification or definition of cell entries. This section describes each of the blocks of cells in the Macro SAM following the numbered sequence shown in Table 8.

The Macro SAMs are compiled using three key data sources. First, the Government Finance Statistics (GFS) database of the International Monetary Fund (IMF) provides detailed information on government revenues and expenditures and follows a standardized accounting framework. Nexus SAMs use the 2014 GFS Manual (GFSM) (IMF 2014b). A mapping between GFSM codes and macro SAM accounts can be found in Table A4 in the Appendix. Second, the IMF maintains detailed Balance of Payments Statistics (BOPS) (IMF 2014a). Nexus SAMs use the sixth BOPS Manual (BPM). A mapping between BPM6 codes and macro SAM accounts can be found in Table A5 in the Appendix. The conversion from US dollars to local currency uses the official exchange rate, as reported in the World Development Indicators (World Bank 2015). Third, countries maintain their own national accounts that include production and expenditure-based GDP estimates. To the extent possible, the Nexus SAMs, like most countries, follow the United Nation’s System of National Accounts (UN 2009).

Table 8: Numbered Entries in a Standard Nexus Social Accounting Matrix

	Activities	Commodities	Factors	Enterprises	Households	Government	Taxes	Investment	Rest of the World
Activities		4			17				
Commodities	1	5			18	23		29	31
Factors	2								32
Enterprises			8			24			33
Households			9	12		25			34
Taxes	3	6	10	13	19				
Government				14	20		28		35
Savings				15	21	26		30	36
Rest of the World		7	11	16	22	27			

1. Intermediate demand (Commodities | Activities)

Definition: Intermediate demand includes payments by activities for the commodities used as non-factor inputs in production processes. For example, payments by the maize activity to the chemical commodity for the fertilizer inputs used to grow maize.

Estimation: Intermediate demand for each activity is estimated in three steps. First, the ratio of total intermediate demand to total value-added in each activity is derived from national IOT/SUTs and, where available, updated using more recent national accounts and/or agricultural and industrial survey data. Second, this ratio is used to derive the absolute level of total intermediate demand based on the estimated level of activity value-added (see Entry 2). Third, total intermediate payments are disaggregated across individual commodities using shares derived from national IOT/SUTs. Note that IOT/SUTs are usually only updated when national statistical agencies rebase national accounts. The quality or accuracy of intermediate input coefficients therefore declines over time until such time as the underlying IOT/SUTs are updated. The description of each SAM in Section 5 indicates the IOT/SUT's benchmark year.

2. Value-added (Factors | Activities)

Definition: Value-added is the returns earned by factors during the production process, such as labor wages and salaries, land rents, and capital profits. Land and capital includes gross operating surplus (GOS), part of which may be reported as "mixed income" in national accounts or IOT/SUTs.

Estimation: Total value-added by activity is estimated in two steps. First, national accounts report the level of gross domestic product (GDP measured in basic prices) for aggregate sectors and these are assigned to groups of SAM activities. Second, aggregate GDP estimates are disaggregated to the level of the SAM activities using information on sub-sectoral production from sources beyond national accounts. The value of activity level agricultural production is estimated using production quantity and producer price data from national Ministries of Agriculture or from the FAO's FAOSTAT database (FAO 2015). Total value-added in each agricultural sector is estimated by multiplying the ratio of GDP to gross output (derived from IOT/SUTs) by the estimated value of activity gross output. Similarly, information on activity-level industrial production is derived from manufacturing or industrial surveys.

Labor value added is disaggregated across the worker categories in Table 3 using national household and/or labor force survey data.⁶ Workers in these surveys report their sector and location of employment, their remuneration levels, and their education levels. Earnings from farm and non-farm enterprises are usually reported at the household level, and these are assigned to individual household members based on their reported employment status and sector of employment. It is assumed that paid and unpaid family members earn equal shares of household enterprise incomes (net of input costs).

3. Taxes on producers (Taxes | Activities)

Definition: Net taxes on production (or net subsidies if SAM value is negative).

⁶ The national household surveys used to build Nexus SAMs are often the same as the surveys used to estimate poverty rates or the weights for the consumer price index. These surveys are similar to the World Bank's Living Conditions Monitoring Surveys (LCMS).

Estimation: The total value of activity taxes (*atax*) is taken from the IMF's GFS and includes "taxes on payroll and workforce" (GFSM code 112). This is disaggregated across activities using information from national tax authorities and/or from the IOT/SUT. For the latter, tax rates are derived from the IOT/SUT and then applied to the sectoral value of GDP and intermediate payments (see Entries 1 and 2). This provides an initial estimate of net activity tax payments, which are then scaled to match the total value of activity tax collections.

4. Marketed output (Activities | Commodities)

Definition: Value of domestically produced goods and services that are supplied to markets, either for domestic use or for export. Marketed output is net non-marketed or home produced and consumed goods and services (see Entry 18).

Estimation: This is a residual balancing item for activities. The value of gross output less the value of non-marketed consumption is paid from each activity to its corresponding commodity, thereby balancing activity rows and columns.

5. Transaction costs (Commodities | Commodities)

Definition: Trade and transport costs associated with moving goods between producers, markets and national borders, either for domestic, import or export trade. For example, exporters incur transport fees when moving goods from their factories to the national border, whereas importers incur fees when delivering goods to domestic markets.

Estimation: There are two approaches to estimating transaction costs in Nexus SAMs. First, margin payments as a share of total demand are estimated using past IOT/SUTs. These rates are then applied to total demand estimates in the SAM to derive new transaction costs. Second, margins are estimated by the gap between producer and market prices, net of indirect taxes, using price data provided by national statistical agencies. The first approach is preferred and is the one typically used for Nexus SAMs (see detailed description of the SAM's data sources in Section 5 for information on which approach was used). Finally, transaction cost margins generate income for trade and/or transport activities.

6. Taxes on products (Taxes | Commodities)

Definition: All indirect taxes imposed on goods and services (or net subsidies if SAM value is negative).

Estimation: Nexus SAMs separate taxes on products into three categories: sales taxes (*stax*), export taxes (*etax*), and import tariffs (*mtax*) (see Table 4). The total value of tax collections is taken from the IMF's GFS. Sales taxes are "taxes on goods and services" (GFSM code 114), which is a summation of various tax instruments, most importantly value-added taxes (GFSM 11411), sales taxes (GFSM 11412), and excise duties (GFSM 1142). Import tariffs (*mtax*) are "taxes on international trade and transactions" (GFSM 115), excluding "taxes on exports" (GFSM 1152), which are assigned to export taxes in the SAM.

Tax revenues are disaggregated across commodities using national tax authority data and/or tax rates estimated from the IOT/SUT. If the IOT/SUT is outdated, then weighted import tariff rates are taken from the United Nations Conference on Trade and Development's Trade Analysis and Information System (TRAINS) (UNCTAD 2015). Tax

rates are applied to the level of domestic sales, imports or exports (see Entries 7 and 32). This provides an initial estimate of commodity level tax payments, which are then scaled to match the total value of each tax revenue category, as estimated above.

7. Imports (Rest of World | Commodities)

Definition: Value of goods and services imported from abroad, less the cost of carriage, insurance and freight.

Estimation: The total value of imports is taken from national accounts, and this is then disaggregated into total goods and total services using current account data from the IMF's BOPS, i.e., BPM6 codes BMG for "goods, debit" and BMS for "services, debit". BOPS provides detailed information on services imports by commodity and this is used to assign imports to service commodities in the SAM (see Table A5 in the appendix). Goods imports are disaggregated across commodities using 6-digit HS gross import flows from the United Nations Commodity Trade Statistics (COMTRADE) database (UNSD 2015).

8. Factor income to enterprises (Enterprises | Factors)

Definition: Mining and "other" capital payments to enterprises, after paying factor taxes and making transfers to the rest of the world (see Entries 10 and 11). These payments equal gross operating surplus, which includes the value of consumption of fixed capital during the production process.

Estimation: This is a residual balancing item for the mining and other capital accounts. Total capital income less capital taxes and foreign transfers is paid to the enterprise account, thereby balancing mining and other capitals' rows and columns.

9. Factor income to households (Households | Factors)

Definition: Labor, land and agricultural capital payments to households, after paying factor taxes and making transfers to the rest of the world (see Entries 10 and 11). These payments equal compensation to workers and returns to land and agricultural capital.

Estimation: This is a residual balancing item for labor, land and agricultural capital accounts, i.e., crop and livestock capital. Total factor incomes less factor taxes and foreign transfers are paid to individual household accounts, thereby balancing these factors' rows and columns. Labor payments to households are disaggregated across household and labor categories using information from national household or labor force surveys (see Entry 2 on treatment on workers' shares of household enterprise incomes). Land and agricultural capital payments to households are disaggregated using survey households' reported incomes from agricultural crops and livestock.

10. Factor taxes (Taxes | Factors)

Definition: Direct taxes paid by mining and "other" capital to the government.

Estimation: The value of capital tax collections is taken from the IMF's GFS. Factor taxes are "taxes on property" (GFSM code 113), which is a summation of various taxes, including wealth and estate taxes and capital levies.

11. Factor payments abroad (Rest of World | Factors)

Definition: Labor, land and capital incomes paid to foreign households or enterprises. For example, workers belonging to foreign households may earn some or all of their

labor incomes in domestic industries and this income may be repatriated back to these workers' home countries. Similarly, some profits generated by foreign-owned mining companies may be repatriated to company headquarters in another country.

Estimation: Factor transfers to the rest of the world are from the IMF's BOPS. Labor transfers are "compensation of employees, debit" (BPM6 code BMIPCE). Capital transfers are "investment income, debit" (BPM6 BMIPI), which includes, amongst others, payments on equity and investment funds to foreign investors.

12. Enterprise transfers to households (Households | Enterprises)

Definition: Indirect capital payments by enterprises to households, after paying corporate taxes and saving and making transfers to government and the rest of the world (see Entries 13, 14, 15 and 16). This includes indirect gross operating surplus paid from the earnings of household nonfarm enterprises.

Estimation: This is a residual balancing item for the enterprise account. Total enterprise income less taxes and transfers is paid to households, thereby balancing the enterprise row and column. Enterprise earnings are paid to households based on households' earnings from nonfarm enterprises, dividends and private pension funds as reported in national household surveys.

13. Corporate taxes (Taxes | Enterprises)

Definition: Corporate and other direct taxes paid by enterprises to the government.

Estimation: The total value of taxes collected from enterprises is taken from the IMF's GFS. This includes taxes "payable by corporations and other enterprises" (GFSM code 1112) and "other taxes on income, profits, and capital gains" (GFSM 1113).

14. Enterprise transfers to government (Government | Enterprises)

Definition: Transfers from enterprises to governments, other than direct tax payments (see Entry 13). For example, domestic banks may provide loans to the government, or parastatal enterprises may pay dividends or repay loans to the general government. Enterprises may also contribute to public social welfare schemes on behalf of their employees.

Estimation: Transfers received by the government from financial and non-financial corporations are taken from the IMF's GFS. This is "property income" (GFSM code 141), which includes, amongst others, interest and dividend payments and payments for rented public property. Transfers from enterprises also include "other taxes" (GFSM 116), which are either paid by business or are unidentifiable. Finally, enterprises include employer contributions to social security (GFSM 1212) and other social schemes (GFSM 1222).

15. Enterprise savings (Savings | Enterprises)

Definition: Domestic private savings by enterprises. This includes reinvested earnings as well as the value of the consumption of fixed capital, i.e., provision for capital depreciation.

Estimation: Total domestic private savings is back-calculated by subtracting public and foreign savings from the value of gross capital formation (see Entries 21, 26, 29 and 36). Unfortunately, few developing countries have the detailed national accounts data needed

to disaggregate domestic private savings across enterprises and households. Accordingly, in the absence of detailed information, the Nexus SAMs assume that enterprises and households have similar savings rates, after enterprises have subtracted their allowance for the depreciation of working capital.

16. Enterprise payments abroad (Rest of World | Enterprises)

Definition: Secondary income transfers from domestic financial and non-financial enterprises to the rest of the world.

Estimation: The value of enterprise foreign payments comes from the IMF's BOPS. This includes "other transfers, debit" (BPM6 code BMISOOT).

17. Private non-marketed consumption (Activities | Households)

Definition: Activity output that is both produced and consumed within the household, i.e., "own" or "home" consumption.

Estimation: Non-marketed consumption is estimated in three steps. First, the share of total private consumption for each Nexus SAM commodity is estimated using aggregate private consumption from national accounts and commodity-level consumption from national household surveys. Second, the share of home consumption in total consumption of each commodity is estimated using the household surveys, and this share of then used to separate total commodity consumption into marketed and non-marketed components. Third, home consumption is disaggregated across household groups using household survey data. Home consumption is defined as any products not purchased in markets, including the consumption of both home-produced products and products received "in-kind" from other households, i.e., without monetary payment.

18. Private marketed consumption (Commodities | Households)

Definition: Commodities that are purchased in markets and consumed by households.

Estimation: Marketed consumption is estimated in three steps. First, the share of total private consumption for each Nexus SAM commodity is estimated using aggregate private consumption from national accounts and commodity-level consumption from national household surveys. Second, the share of home consumption in total consumption of each commodity is estimated using the household surveys, and this share of then used to separate total commodity consumption into marketed and non-marketed components. Third, marketed consumption is disaggregated across household groups using household survey data. Marketed consumption is defined as any products purchased in markets, i.e., not home produced or received "in-kind" from other households.

19. Household taxes (Taxes | Households)

Definition: Direct income or personal taxes paid by households. For example, households often "pay as you earn" (PAYE) taxes to the government based on their wages and salaries.

Estimation: Total tax collection is taken from the IMF's GFS. It includes taxes on income, profits and capital gains that are "payable by individuals" (GFSM code 1111). This is disaggregated across the household groups in the Nexus SAMs using personal income tax rates reported by households in the national household survey. If tax data is not available or is poorly captured in the survey, then incomes from secondary and

tertiary educated labor is used as a proxy for disaggregating total direct tax collections (see Table 3).

20. Household transfers to government (Government | Households)

Definition: Payments by household to the government other than for direct taxes (see Entry 19). For example, households may contribute to public social welfare schemes, including retirement and healthcare funds.

Estimation: The total value of transfers is taken from the IMF's GFS. This is social security and other social contributions, including payments by employees (GFSM codes 1211 and 1221), self-employed and unemployed people (GFSM 1213), and non-allocated and imputed contributions (GFSM 1214 and 1223). Household transfers to government also include various other revenue sources, including from sales of goods and services (GFSM 142), and fines penalties and forfeits (GFSM 143).

21. Household savings (Savings | Households)

Definition: Domestic private savings by households.

Estimation: Total domestic private savings is back-calculated by subtracting public and foreign savings from the value of gross capital formation (see Entries 21, 26, 29 and 36). Unfortunately, few developing countries have the detailed national accounts data needed to disaggregate domestic private savings across enterprises and households.

Accordingly, in the absence of detailed information, the Nexus SAMs assume that enterprises and households have similar savings rates, after enterprises have subtracted their allowance for the depreciation of working capital. Household savings are then disaggregated across household groups in the SAM using information from national household surveys. Although survey households often report the value of deposits made into bank accounts or the amount of savings during the year, including private pension contributions, this information is often poorly captured. In such cases, proxy indicators are derived from household earnings from enterprises and incomes from higher educated labor.

22. Household payments abroad (Rest of World | Households)

Definition: Secondary income transfers from households to the rest of the world.

Estimation: The value of household foreign payments comes from the IMF's BOPS. This includes "personal transfers, debit" (BPM6 code BMISOPT). Transfers are disaggregated across household groups in the SAM using information from national household surveys that capture the amount of remittances households sent abroad.

23. Government consumption (Commodities | Government)

Definition: Government recurrent spending on goods and services. Public consumption demand by the government institution is the primary source of demand for services produced by government activities, which consist of public administration, education, and health and social work.

Estimation: The total value of government consumption is taken from a country's national accounts data. This is cross-checked against recurrent expenditures in the IMF's GFS, which reports government's "compensation of employees" (GFSM code 21), "use of goods and services" (GFSM 22), and "consumption of fixed capital" (GFSM 23). Total consumption is disaggregated across commodities using budget shares derived

from the IOT/SUT, and then adjusted to reflect changes in the composition of supply of public administration, education, and health and social work services.

24. Government transfers to enterprises (Enterprises | Government)

Definition: Transfers from the government to enterprises. For example, the government may pay interest or repay the principal on a loan from a domestic bank, or the government may lend money to parastatal companies.

Estimation: Transfers paid by the government to financial and non-financial corporations are taken from the IMF's GFS. This is interest payments to nongovernment residents (GFSM code 242), subsidies to public corporations and private enterprises (GFSM 25) and "other expenses" (GFSM 28). The latter includes property expenses like dividend and rental payments.

25. Government transfers to households (Households | Government)

Definition: Payments by the government to households. For example, governments may pay households from a public pension or cash transfer scheme.

Estimation: The total value of transfers is taken from the IMF's GFS. This is social benefits (GFSM code 27), which includes social security, social assistance, and other employment-related social benefits, each of which may be paid in cash or in-kind.

26. Government savings (Savings | Government)

Definition: Recurrent fiscal surplus for the government (of deficit if cell entry is negative). Note that this is the difference between revenues and recurrent expenditures, i.e., before public capital investment. Recurrent expenditures include public consumption spending (see Entry 25) and transfers to domestic and foreign institutions (see Entries 24, 25 and 27).

Estimation: This is the residual balancing item for the government account, although it cross-checked against the difference between total revenues and total recurrent expenses in the IMF's GFS (GFSM codes 1 and 2). Any deviation from GFS data is due to the Nexus SAM giving preference to statistics from national accounts (for indirect tax collections and government consumption spending, see Entries 3, 6 and 23) and to the IMF's BOP database (for foreign transfers, see Entries 27 and 35).

27. Government payments abroad (Rest of World | Government)

Definition: Transfers from the government to the rest of the world. For example, government may provide foreign aid to other countries, or must pay interest or repay loans to foreign governments and financial enterprises.

Estimation: The value of government foreign payments comes from the IMF's BOPS, and is cross-checked against the IMF's GFS. BOPS-based payments include "general government transfers, debit" under secondary income (BPM6 code BMISG). GFS-based payments include interest payments to nonresidents (GFSM code 241), and grants paid to foreign governments and international organizations (GFSM 26).

28. Tax revenues paid to government (Government | Taxes)

Definition: Revenues transferred from individual tax accounts to the government account.

Estimation: This is a residual balancing item for the tax accounts in the SAM. The distinction between taxes and the government account allows the SAM to disaggregate indirect taxes on commodities, i.e., sales taxes, export taxes, and import tariffs (see Entry 6).

29. Gross capital formation

(Commodities | Investment)

Definition: Combination of gross fixed capital formation (GFCF) and changes in stocks or inventories. GFCF is the spending on commodities involved during the investment in capital stock. For example, investment typically involves the purchase of machinery, vehicles and equipment, as well as payments for constructing new factories and storage facilities. Changes in stocks occur when businesses carry-over stock for sale in subsequent years, or when they sell products in the current year that were produced in previous years. Positive values in the SAM indicate an accumulation of stocks and negative values indicate a depletion of stocks. Finally, note that the Nexus SAMs combine private, public and foreign investment, just as they combine private, public and foreign savings (see Entries 15, 21 and 26).

Estimation: The Nexus SAMs distinguish between GFCF (*s-i*) and changes in stocks (*dstk*). SAM entries are determined in two steps. First, the total value of GFCF and stock changes are taken from official national accounts data. Second, these total values are disaggregated across commodities using expenditure shares from the IOT/SUT. In some cases, countries report the composition of GFCF on an annual basis, in which case this information is used in place of the IOT/SUT shares. The same is true for stock changes, although most countries only report detailed stock changes when a new IOT/SUT is produced during the rebasing of national accounts. Although commodity level stock changes in Nexus SAMs typically deviate from national accounts, this is not overly concerning since they are usually an exogenous decision variable in economy-wide models.

30. Inventory or stock change adjustment (Savings | Investment)

Definition: The accumulation of stocks for sale in subsequent years are added to the amount of savings available in the country (and a depletion of stocks reduces savings). For example, if an activity produces a machine this year for sale next year then they are effectively saving the value of the machine (or investing in future sales). This transfer of total stock changes to the savings account was not shown in Table 1, because it nets to zero in SAMs that aggregate gross fixed capital formation (GFCF) and changes in stocks.

Estimation: This is a residual balancing item for the change in stocks account (see Entry 29). The total value of stock changes is paid to the savings account. A positive value means a net accumulation of stocks and a negative value means a net depletion.

31. Exports

(Commodities | Rest of World)

Definition: Value of goods and services exported abroad.

Estimation: The total value of exports is taken from national accounts, and this is then disaggregated into total goods and total services using current account data from the IMF's BOPS, i.e., BPM6 codes BXG for "goods credit" and BXS for "services credit". BOPS provides detailed information on services exports by commodity and this is used to assign exports to service commodities in the SAM (see Table A5 in the appendix).

Goods exports are disaggregated across commodities using 6-digit HS gross export flows from the United Nations Commodity Trade Statistics (COMTRADE) database (UNSD 2015).

32. Foreign transfers to factors (Factors | Rest of World)

Definition: Labor, land and capital incomes received from the rest of the world. For example, workers belonging to domestic households may earn some or all of their labor incomes working in a foreign country and this income may be repatriated. Similarly, domestically-owned companies may repatriate profits earned abroad.

Estimation: Factor transfers from the rest of the world are from the IMF's BOPS. Labor receipts are "compensation of employees, credit" (BPM6 code BXIPCE). Capital receipts are "investment income, credit" (BPM6 BXIPI), which includes, amongst others, income on foreign equity and investment funds.

33. Foreign transfers to enterprises (Enterprises| Rest of World)

Definition: Secondary income transfers from the rest of the world to domestic financial and non-financial enterprises.

Estimation: The value of enterprise foreign receipts comes from the IMF's BOPS. This includes "other transfers, credit" (BPM6 code BXISOOT).

34. Foreign transfers to households (Households| Rest of World)

Definition: Secondary income transfers from households to the rest of the world. For example, households may receive remittance incomes from family members working abroad.

Estimation: The value of household foreign incomes comes from the IMF's BOPS. This includes "personal transfers, credit" (BPM6 code BXISOPT). Transfers are disaggregated across household groups in the SAM using information from national household surveys that capture the amount of remittances households received from abroad.

35. Foreign transfers to government (Government| Rest of World)

Definition: Transfers from the rest of the world to the government. For example, government may receive foreign aid from other countries.

Estimation: The value of government foreign receipts comes from the IMF's BOPS, and this is cross-checked against the IMF's GFS. BOPS-based receipts include "general government transfers, credit" under secondary income (BPM6 code BXISG). GFS-based payments include grants received from foreign governments and international organizations (GFSM code 131 and 132).

36. Foreign savings (Savings | Rest of World)

Definition: Current account balance equal to total foreign capital or savings inflows.

Estimation: This is the residual balancing item for the rest of world account, although it cross-checked against the current account balance reported in the IMF's BOPS (BPM6 code 1). Any deviation from BOPS data – and this is usually small – is due to the Nexus SAM giving preference to total the value of imports and exports reported in national accounts (see Entries 7 and 31).

4. BALANCING NEXUS SOCIAL ACCOUNTING MATRICES

Nexus SAMs are constructed in three stages using the IFPRI SAM Building Toolkit. The toolkit uses a standardized template in Microsoft-Excel® to construct and export an unbalanced SAM to a compilation and balancing program that is executed in the General Algebraic Modeling System (GAMS).

During the first stage of the SAM Toolkit, a Macro SAM is constructed using the data described in previous sections. The three main data sources for the Macro SAM are national accounts, the IMF's Government Finance Statistics (GFS) database, and the IMF Balance of Payments Statistics (BOPS) database. Unfortunately, in many developing countries, these three data sources are not fully reconciled. For example, the total value of exports and imports in national accounts may not exactly match the values appearing in BOPS. Preference is given to certain data sources. For instance, Nexus SAMs always use national accounts data instead of trade data from BOPS or government consumption spending estimates from GFS. Similarly, preference is given to data from BOPS over that from GFS when estimating transfers between the government and the rest of the world. Row and column totals in the Macro SAM are reconciled manually through various residual balancing items:

- Marketed supply balances the activity accounts (see Entry 4);
- Transfers to households or enterprises balances the factor accounts (see Entry 8 and 9);
- Transfers to households balances the enterprise account (see Entry 12);
- Household and government savings balance the household and government accounts (see Entries 21 and 26); and
- Foreign savings balances the rest of world account (see Entry 36).

During the second stage, income and expenditure shares derived from surveys and other sources are used to disaggregate the Macro SAM entries across detailed activities, commodities, factors, and households. Sectoral and product data is used to disaggregate production and trade, and survey data is used to disaggregate factor and household incomes and consumer demand. There are always imbalances between the level of supply and demand for commodities and between household incomes and expenditures. These imbalances are manually checked for misclassification issues and logical errors in data collection and reporting. However, imbalances invariably remain, so Nexus SAMs use cross-entropy estimation techniques to reconcile row and column totals at the detailed commodity and household level. For more information on cross-entropy-based reconciliation of SAM accounts, see Robinson et al. (2001).

Finally, in the third stage, Standard Nexus SAM entries are further disaggregated to include sex-disaggregated and regional information. As above, separating activities, factors, and households always introduces new imbalances. These are reconciled using a second round of cross-entropy estimation techniques.

5. THE DATA SOURCES FOR THE 2015 SOCIAL ACCOUNTING MATRIX FOR TUNISIA

The 2015 Tunisian SAM follows the Standard Nexus structure, as described in Section 2. Table 9 lists the data sources used to construct the SAM. All major data sources are consistent with those used for Standard Nexus SAMs, as described in Section 3.

Table 9. Summary of Data Sources for the Tunisian Social Accounting Matrix

Data needs	Data year	Country data sources	Reference
Macroeconomic structure			
National accounts	2015	National accounts, 2015	NIS (2018a)
Government finance	2015	Ministry of Finance	MoF (2018)
Balance of payments	2015	BPM6 online database	IMF (2018)
Input-output table (IOT)			
Aggregate structure	2015	Supply-use table, National accounts	NIS (2018a)
Agriculture subsectors	2015	Ministry of Agriculture, Water Resources and Fishery	MAWRF (2018b)
Industrial subsectors	2015	Supply-use table	NIS(2018a)
Disaggregating activities			
Aggregate sectors	2015	Supply-use table, National accounts	NIS (2018a)
Crops and livestock subsectors	2015	FAOSTAT online database	FAO (2018)
Regional disaggregation of crop production	2015	Economic Budget, Agricultural Statistical yearbook, National Agriculture Observatory (ONAGRI) database	MAWRF (2018a)
Regional disaggregation of livestock production	2015	Economic Budget , Agricultural Statistical yearbook, ONAGRI database	MAWRF (2018a)
Regional disaggregation of fish production	2015	Economic Budget, Agricultural Statistical Yearbook, ONAGRI database.	MAWRF (2018a)
Industrial subsectors	2015	Supply-use table, National accounts	NIS (2018a)
Regional disaggregation of industrial production	2015	Statistics compiled from the Tunisian Business Register, 2015	NIS (2018d)
	2015	Open data platform of the Ministry of Industry	Mol (2019)
	2015	Activity Reports for Electricity and Water	STEG, SONEDE (2016)
Disaggregating commodities			
Private consumption	2015	Supply-use table	NIS (2018a)
Public consumption	2015	Supply-use table	NIS (2018a)
Gross fixed capital formation	2015	Supply-use table	NIS (2018a)
Goods trade	2015	COMTRADE online database	UNCTAD (2018)
Services trade	2015	BPM6 online database	IMF (2018)
Indirect tax rates	2015	Supply-use table	NIS (2018)
	2015	TRAINS Most Favored Nation rates	UNCTAD (2018)
Subsidy rates	2015	Supply-use table	NIS (2018a)
Transaction cost margins	2015	Supply-use table	NIS (2018a)
Labor	2014	Tunisia-Labor Market Panel Survey	ERF & NIS (2016)
Households	2015	Households' Budget, Consumption and Standard of Living Survey (HBCSL)	NIS (2017)

Activities: Tunisian's national accounts were rebased using a 1997 base year and detailed IOT and SUT generated. Updated SUTs and IOTs were then estimated and published yearly at an aggregate level (20 sectors and 20 commodities). For 2015, national accounts provided GDP estimates for 40 Nexus sectors and 60 commodities with sufficient detail for

the industry and service sector GDPs. The IOT table includes only three agricultural sectors – agriculture, fisheries, and forestry. To be close to the Nexus disaggregation of 86 activities, notably for the agriculture sector, technical coefficients for agriculture subsectors have been estimated according to the cost structure of the disaggregated agricultural activities published by the Ministry of Agriculture, Water Resources and Fishery (MAWRF). The disaggregation of the agricultural sector at national and regional levels was done by an expert on Tunisia’s agricultural production.⁷ We also used crop and livestock production and price data from FAOSTAT (see Section 3). National accounts were aggregated to the Nexus 86 activities using the ISIC Revision 4 concordance (see Table A1 in the appendix). It should be noted that some Nexus activities were not covered by national accounts and are aggregated according to the Nexus format (see Table A6 in the appendix).

Commodities: National accounts report GDP by expenditure group, i.e., private and public consumption, investment demand, and exports and imports. These groups were disaggregated across the Nexus commodities using the following data:

- Six-digit COMTRADE and itemized IMF BOPS data were used to disaggregate international goods and services trade, respectively.
- The 2015 SUT was used to disaggregate total private consumption spending across commodities.
- Public consumption spending was disaggregated across public administration, health, and education using the 2015 SUT.
- Initial indirect tax rates were estimated using sales tax collection rates calculated from the 2015 SUT. Import tariffs and subsidy rates were estimated based on information from the 2015 SUT.

Labor: The updated IOT separates sectoral GDP into compensation of employees and gross operating surplus. Labor value-added was disaggregated using a sector-level operating account for 2015 and the Tunisian Labor Force Panel Survey (TLMPS). The latter provides information on wage earnings, as well as farm and non-farm enterprise revenues.

Households: Household incomes and expenditures were disaggregated across representative household groups using information from the 2015 Household Budget, Consumption, and Standard of Living Survey (HBCSL) and the TLMPS. Households receive factor incomes based on reported earnings of individual household members. The value-added generated by cropland and livestock capital were paid to household groups based on their reported farm enterprise revenues. Direct tax payments were assumed to be proportional to secondary and tertiary-educated workers’ wage and non-farm enterprise earnings. Transfers received from the government were estimated using the information related to government program coverage from HBCSL. Finally transfers received from the rest of the world were assumed to be proportional to workers’ wage. More specifically, the ratio of transfer earnings to total household consumption was used to estimate initial transfer incomes. These were then scaled uniformly across all households in order to match the total value of transfers appearing in government and balance of payments statistics.

Regions: For the regionalized SAM, sectoral production, production factors, and household groups are disaggregated into seven subnational regions: Greater Tunis, North East, North

⁷ Mr. Anis Ben Younes, a co-author of this report.

West, Center East, Center West, South East, and South West (Figure 1). The regional 2015 SAM in total has 105 household groups and is composed of 513 rows x 513 columns.

Figure 1: Map of Regions used in the Regional 2015 Social Accounting Matrix for Tunisia

Source: Authors.

Note: Lines within the SAM regions are governorate boundaries.

Data files: The Microsoft Excel® file (TUN_N86_2015.xlsx) accompanying this documentation includes the following worksheets:

- **Notes:** Description of the Tunisian Nexus SAM accounts.
- **SAM v86N:** The 2015 national SAM with the standard 86-sector Nexus structure.
- **SAM v70R:** The 2015 regional SAM with the standard 70-sector Nexus structure.

The number of activities/commodities used in the SAM description is based on the number of Standard Nexus accounts considered when constructing the SAM (see Table 2). It should be observed that not all Nexus activities and commodities are present in the Tunisian SAM, such as crude oil.

Table A2. Detailed Classification of Nexus 86 Agricultural Activity Accounts

Code	Description (FAOSTAT crop and livestock product codes in parentheses)
maiz	Maize (56)
sorg	Millet (79); Sorghum (83)
rice	Paddy rice (27)
whea	Wheat (15); Barley (44)
ocer	Rye (71); Oats (75); Buckwheat (89); Quinoa (92); Fonio (94); Triticale (97); Canary seed (101); Mixed grain (103); Cereals not elsewhere specified (108)
puls	Dry beans (176); Dry broad beans and horse beans (181); Dry peas (187); Chick peas (191); Dry cow peas (195); Pigeon peas (197); Lentils (201); Bambara beans (203); Vetches (205); Lupins (210); Pulses not elsewhere specified (211)
gnut	Groundnuts with shell (242)
oils	Soybeans (236); Coconuts (249); Palm oil fruit (254); Palm kernels (256); Palm oil (257); Olives (260); Karite nuts (sheanuts) (263); Castor oil seed (265); Sunflower seed (267); Rapeseed (270); Tung nuts (275); Jojoba seed (277); Safflower seed (280); Sesame seed (289); Mustard seed (292); Poppy seed (296); Melonseed (299); Tallowtree seed (305); Vegetable tallow (306); Stillingia oil (307); Cottonseed (329); Linseed (333); Hempseed (336); Oilseeds not elsewhere specified (339)
cass	Cassava (125)
ipot	Potatoes (116)
spot	Sweet potatoes (122)
root	Yautia (cocoyam) (135); Taro (cocoyam) (136); Yams (137); Roots and tubers not elsewhere specified (149)
leaf	Cabbages and other brassicas (358); Artichokes (366); Asparagus (367); Lettuce and chicory (372); Tomatoes (388); Cauliflowers and broccoli (393); Pumpkins, squash and gourds (394); Cucumbers and gherkins (397); Eggplants (aubergines) (399)

Code	Description (FAOSTAT crop and livestock product codes in parentheses)
vege	Chilies and peppers, green (401); Green onions and shallots (402); Dry onions (403); Garlic (406); Leeks and other alliaceous vegetables (407); Green beans (414); Green peas (417); Leguminous vegetables not elsewhere specified (420); String beans (423); Carrots and turnips (426); Okra (430); Green maize (446); Mushrooms and truffles (449); Chicory roots (459); Carobs (461); Fresh vegetables not elsewhere specified (463)
sugr	Sugar cane (156); Sugar beet (157); Sugar crops not elsewhere specified (161)
toba	Unmanufactured tobacco (826)
cott	Kapok fruit (310); Seed cotton (328); Flax fiber and tow (773); Hemp tow waste (777); Jute (780); Bastfibers, other (782); Ramie (788); Sisal (789); Agave fibers not elsewhere specified (800); Manila fiber (abaca) (809); Fiber crops not elsewhere specified (821)
nuts	Brazil nuts with shell (216); Cashew nuts with shell (217); Chestnut (220); Almonds with shell (221); Walnuts with shell (222); Pistachios (223); Kola nuts (224); Hazelnuts with shell (225); Areca nuts (226); Nuts not elsewhere specified (234)
bana	Bananas (486); Plantains (489)
frui	Oranges (490); Tangerines, mandarins, clementines and satsumas (495); Lemons and limes (497); Grapefruit (including pomelos) (507); Citrus fruit not elsewhere specified (512); Apples (515); Pears (521); Quinces (523); Apricots (526); Sour cherries (530); Cherries (531); Peaches and nectarines (534); Plums and sloes (536); Stone fruit not elsewhere specified (541); Pome fruit not elsewhere specified (542); Strawberries (544); Raspberries (547); Gooseberries (549); Currants (550); Blueberries (552); Cranberries (554); Berries not elsewhere specified (558); Grapes (560); Watermelons (567); Other melons (including cantaloupes) (568); Figs (569); Mangoes, mangosteens, and guavas (571); Avocados (572); Pineapples (574); Dates (577); Persimmons (587); Cashew apple (591); Kiwi fruit (592); Papayas (600); Fresh tropical fruit not elsewhere specified (603); Fresh fruit not elsewhere specified (619)
coco	Cocoa beans (661)
coff	Green coffee (656)
teal	Tea (667); Mata (671); Tea not elsewhere specified (674)
flwr	Not reported in FAOSTAT
rubb	Natural rubber (836); Natural gums (839)
ocrp	Hops (677); Pepper (piper spp.) (687); Dry chilies and peppers (689); Vanilla (692); Cinnamon (canella) (693); Cloves (698); Nutmeg, mace and cardamoms (702); Anise, badian, fennel and coriander (711); Ginger (720); Spices not elsewhere specified (723); Peppermint (748); Dried pyrethrum (754)
catt	Cattle meat (867); Indigenous cattle meat (944); Live weight cattle meat (945)
milk	Whole fresh cow milk (882); Whole fresh buffalo milk (951); Whole fresh sheep milk (982); Whole fresh goat milk (1020); Whole fresh camel milk (1130)
poul	Chicken meat (1058); Duck meat (1069); Indigenous duck meat (1070); Live weight duck meat (1071); Goose and guinea fowl meat (1073); Indigenous goose meat (1077); Live weight goose meat (1078); Turkey meat (1080); Indigenous bird meat not elsewhere specified (1084); Other live weight poultry meat (1085); Indigenous turkey meat (1087); Live weight turkey meat (1088); Bird meat not elsewhere specified (1089); Indigenous chicken meat (1094); Live weight chicken meat (1095)
eggs	Hen eggs in shell (1062); Other bird eggs in shell (1091)
smlr	Sheep meat (977); Greasy wool (987); Indigenous sheep meat (1012); Live weight sheep meat (1013); Goat meat (1017); Indigenous goat meat (1032); Live weight goat meat (1033)
oliv	Buffalo meat (947); Indigenous buffalo meat (972); Live weight buffalo meat (973); Pig meat (1035); Indigenous pig meat (1055); Live weight pig meat (1056); Horse meat (1097); Ass meat (1108); Mule meat (1111); Indigenous horse meat (1120); Live weight horse meat (1121); Indigenous ass meat (1122); Live weight ass meat (1123); Indigenous mule meat (1124); Live weight mule meat (1125); Camel meat (1127); Indigenous camel meat (1137); Live weight camel meat (1138); Rabbit meat (1141); Indigenous rabbit meat (1144); Live weight rabbit meat (1145); Other rodent meat (1151); Indigenous rodent meat (1154); Live weight rodent meat (1155); Other camelid meat (1158); Indigenous other camelid meat (1161); Live weight other camelids meat (1162); Game meat (1163); Meat not elsewhere specified (1166); Snails (1176); Natural honey (1182); Beeswax (1183); Silk-worm cocoons (1185)

ABOUT THE AUTHORS

Rim Ben Salhine is a principal economist at Institut Tunisien de la Compétitivité et des Etudes Quantitatives (ITCEQ), based in Tunis. **Anis Ben Younes** is a consultant agronomist, based in Tunis. **Zouhair El Kadhi** is the Director General of ITCEQ. **Belhassen Jebali** is a principal economist at ITCEQ. **Elyes Kasdallah** is a statistical engineer at ITCEQ. **Thouraya Lakoud** is a principal economist at ITCEQ. **Mariam Raouf** is a Research Associate in IFPRI's Egypt Strategy Support Program, based in Cairo. **Manfred Wiebelt** is a Senior Research Fellow and Professor of Economics at the Kiel Institute for the World Economy, Kiel, Germany.

ACKNOWLEDGMENTS

The staff of the Institut Tunisien de la Compétitivité et des Etudes Quantitatives (ITCEQ) and the IFPRI team thank all those who collaborated with us in producing this significant output. We would like to pay special tribute to the National Institute of Statistics for their support and for providing all of the relevant data. We also gratefully acknowledge the financial support provided by the International Fund for Agricultural Development (IFAD) and CGIAR-PIM towards the construction of the disaggregated SAM of the Tunisian economy and related capacity building sessions under the (Arab) Agriculture Investment for Development Analyzer (AIDA) project, which is implemented by IFPRI.

ITCEQ and IFPRI look forward to receiving feedback and comments on the disaggregated SAM for Tunisia from those interested in economic and financial studies, especially studies that may contribute to improving and building upon this body of work.
